

German somatic gene transfer clinical trial database

The progressive developments in biotechnology and medicine have led to the creation of the field of molecular medicine/gene and cell therapy.

In the process, gene transfer studies have as their aim the medical treatment of a person for the purposes of prophylaxis (prevention), therapy or diagnostics of diseases. The German Register for Somatic Gene Transfer (DeReG) aims at facilitating the acquisition of knowledge in the field of gene therapy and makes it accessible for the public, that is, physicians, patients, the scientific community, the media and not least the interested public.
